French player lands key contract on Eni's Congo FLNG project

Geocean will install a submerged swivel and yoke system and flexible riser for the project

French marine company Geocean has signed a contract with China's Wison New Energies to transport and install the mooring system for a floating liquefied natural gas vessel destined for Eni Congo LNG project in Congo-Brazzaville.

Phase one of the Italian major's liquefaction scheme is already producing LNG via its Tango floating LNG vessel which has a capacity of 1 million tonnes per annum. Phase two involves Wison's 2.4 million tpa capacity FLNG vessel.

Geocean will be responsible for installing a submerged swivel and yoke system anchored via three drilled piles and connected to the FLNG vessel via a single flexible riser.
